EGAS C Report – Statistics 2014

on European Gas Safety
Part C: Gas Installations

— Summary
— Introduction
— Data Base and Definitions
— Analysis and Results
— Conclusions
— ANNEX: Collected 2014 data in the aggregate for the 8 participating Countries

Edited by: Marcogaz

B - 1000 Brussels
Introduction

Utilisation of large quantities of natural gas in Industry as well as in commercial, domestic and traffic applications is ranked as very safe among industry experts.

Nevertheless, the public awareness and the media are more focused on spectacular accidents than on safety records or statistical values. But rational discussion about safety and risk in the gas installations is only possible if it is based on unbiased facts and figures.

Furthermore, the Gas Industry itself wants to show its safety record and wants to identify its own weak points to be able to allow for risk-oriented and economical improvements.

Therefore, in 1995 nine major Gas Companies and National Industry Associations began to gather data on gas-related accidents in their Countries. Collection of data, exchange of views and development of improving measures was formalised by setting up the ETPS (European Third Party Safety) group.

In 2005 this ETPS group joined MARCOGAZ to allow for a broader data base in new European Countries and above all to allow for a better communication of the safety performance of the European Natural Gas Industry.

In 2008 MARCOGAZ, taking into account the unbundling of Companies, decided to split ETPS into two specific groups, ensuring thus a more accurate and reliable data collection:

- "Gas Distribution" under the designation EGAS B,
- "Gas Installations" under the designation EGAS C,

This report gives an overview on the EGAS C data base and on the main analyses and results in a statistical way, shown in tables and different graphs. Some conclusions at the end aim at easier understanding of the statistical findings. The indicated parameters represent a set of safety performance indicators used in the European Natural Gas Industry.

Statistics in this report concern only domestic, residential, commercial and tertiary installations.
EGAS C - Data Base and Definitions

Period: 1995 - 2014
Number of contributing Countries: 8

YEAR 2014: representing a total number of approximately 86 million connected customers of and a total length of gas distribution mains of around 1.340.000 km

Participating countries in the MARCOGAZ EGAS C group for 2014:
- Finland
- France
- Germany
- Great Britain
- Italy
- (The) Netherlands
- Slovakia
- Spain

Table C1 EGAS C general information

Note: the statistics of 2003 are no longer included since the data collection had not been completed.

Gas installations: Gas pipeworks (pipes and fittings) and gas appliances (including flue systems) situated after the point of delivery. Such installations are normally under the responsibility of the customer.

Accident - An unintentional event, related to natural gas, which has caused physical injuries or fatalities or big material damage.

Injury - Injury, as a consequence of a natural gas accident that needs a hospitalization of at least one night.

Fatality – Death, as a consequence of a natural gas accident immediately or within 30 days of the event.

Customer – Person under contract for the supply of gas

Table C2 Definitions for the EGAS C data base
Fig. C1 illustrates the ratio of accidents/injuries/fatalities to 1 million customers for each year from 1995 to 2014 – **AVERAGE FATALITIES IN 2014: 0.77 per 1 million Customers**

Fig. C2 illustrates the ratio of accidents/injuries/fatalities to 10,000 km length of gas distribution mains for each year from 1995 to 2014 – **AVERAGE FATALITIES IN 2014: 0.49 per 10,000 km of mains**
CO Poisoning remains the main cause of fatalities in 2014 (8 contributing countries representing a total number of 86 million customers and a total length of gas distribution mains of 1.134,000 km).

Respective share of causes for fatalities in 2014

To note, as a supplementary information for 2014, 11 fatalities (16.6% of the total) due to intentionally caused accidents (suicide, manipulation), then a rather high rate.

Fig. C6 illustrates the evolution of fatalities over the years
Conclusions

A. The EGAS C data base proves clearly its statistical representativeness in the field of the European Natural Gas Installations, based on 8 Countries for 2014, representing appr. 86 million gas customers, and recorded since 1995 (with the exception of 2003, see note); In a general manner the diagrams display a decreasing trend of incidents/accidents, particularly the number of fatalities which is very low with a ratio of 0.77 per 1 Mio gas customers (see fig. C1) and 0.49 per 10,000 km of length of gas distribution mains (see fig. C2) for the year 2014.

B. Regarding the causes (see Fig. C4), divided into FIRE, EXPLOSION, ASPHYXIA, and CO POISONING, the latter still represents the highest share for fatalities, however with clear downward trend. An increase in the explosions is noted, mostly due to intentional actions.

C. The fatalities accounted by intentional acts (16.6 %) have sharply increased.

D. Although the European Gas Industry can display excellent Safety Performance Indicators in the field of gas installations, it will keep up maintaining and improving technical measures towards gas safety.

NOTE
The information and data included in this document have been compiled by MARCOGAZ from a variety of sources from its Members. MARCOGAZ will not accept any liability for the data accuracy and completeness.

**Accident** - An event, related to natural gas, which has caused physical injuries or fatalities, or/and material damage. Causes are: fire or explosion or CO poisoning or asphyxiation.

**Fatality** - Death, as a consequence of a natural gas accident, immediately or within 30 days of the event.

**Injury** - Injury, as a consequence of a natural gas accident that needs a hospitalization of at least one night.
